The present invention describes a recombinant adequests systems to we vector, which comprises a partial or total deletion of a protein IX DNA and a quone encoding a foreign protein. The recombinant adequations wertor can be vectorstatic activity and be used in quone though, the recombinant adenovirus expression vector is particularly useful for treating the recombinant adenovirus expression vector is particularly useful for treating cancer, analy self lung cancer, analy self lung cancer, breatto a fumour, e.g. non small cell lung cancer, melanoma, retinoblastoma, breast tumour, colorectal carrinoma, sarroma, prostate tumour, bladder tumour, tumour of the reticulorablastoma, tissues, Wilm's tumour, astrocytoma diloblastoma, neuroblastoma, escondarian carcinoma, astrocytoma or renal cancer. The present sequence encodes the retinoblastoma tumour suppressor protein pl10-RB, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 110

```
This sequence encodes a modified relinoblastoms tuned suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting cellular proliferation, when coadministered with a p53 protein. The RTSPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The RISPs have a broader spectrum of activity than wild type RISPs.

```
This sequence encodes a modified retinoblastoma tumour suppressor protein (RISP) of the invention. The proteins can be used for inhibiting regular prolliteration, when coadministered with a p53 protein. The RISPs can be used for treating diseases characterised by abnormal cellular prolliferation, particularly cancers. The RISPs have a broader spectrum of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified retinoblastema tomour suppressor: BTSP protein; cancer therapy; cellular proliferation inhibitor; ss.

The present sequence appears in the specification, which describes a sequence encoding a Lusion protein comprision a transcriptional responsive expression vector (TREV), which contains a sequence encoding a Lusion protein comprision a transcriptional ransactivation domain (TTE) preservely attached to a tetracycline refressor protein (TRE), the first sequence operatively positioned downstream of a promoter. The vector also contains a cloning site operatory prestricts and absent produce stable cell retracycline perfector. The TREVS can be used to produce stable cell lines in which gene expression is tightly restricted by tetracycline. They can be used for the production of proteins such as tumour suppression provides which can be used for the production of proteins such as tumour suppression because the production of proteins such as tumour suppression provides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             367 CAGAAAAACAIAGAAAICAGIGICCAIAAAIICIIIAACIIACIAAAAAGAAAIIGAIAC: 426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               81 ValScrScrValAspClyValLesSlyClyTyrIleGletysLysLysGluLeuTrpGly 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      e.d. the number of mitotic divisions, of a cell. The method relies on activities with the method relies on activities at telemenase activity and inhibition of one or both of a telemenase activity and inhibition of the period of a post pathway. The spheriation of the transfer order and analym members, e.g. the tumour species appreason ple NRA inhibits kinase activity and results in growth arrest. Rb inactivators can beleatively and results in growth arrest. Rb inactivators can beleatively and results in growth arrest. Rb inactivators can beleatively and results in growth arrest. Rb inactivators can beleatively and results in growth arrest. Rb inactivator and religious and results in such a cellular inhibitor of Rb/E22 function and the p33 tumour suppressor and can also be used in the method. Other methods which can be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention concerns methods and reagents for extending the life-span,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The Rb and pis NR4a genes may also be used. The methods are useful for the Rb and pis NR4a genes may also be used. The methods are useful for humasing the proliferative capacity of gells. The eglls are subsequently of use in plantamentatical and cosmettic preparations used to treat conditions related to (prematore) against a manufact dequator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprises administering agents reversibly and ivating telemetase activity and reversibly inactivating Rb/INK4 and/or p53 pathways useful in treating age related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 include c4k4 or c4k6 mutants. In particular, a c4k4 mutant is one which differs from at one or more of residues K22, 924 H45 and/or P47 Additional constructs include a papilloma virus E7 protein, or other

present invention can be used in screening assays to identify candidate pharmaceutical melecules for the ability to promote or inhibit the interaction of androgen receptors and androgen responsive elements to modulate androgenic eclivity. The identification and characterisation of androgen receptor co-activity as such as those of the invention will tacilitate the development of screening assays to evaluate the potential efficacy of drugs in the treatment of prostate cancer.

```

The present sequence appears in the specification, which describes a tetracycline responsive expression vector (TREM), which describes a tetracycline responsive expression vector (TREM), which contains a sequence encoding a fusion protein comprising a transcriptional transactivition domain (TD) operatively attached to a tetracycline repressor protein (TRP), the lins sequence operatively positioned downstream of a basal promoter comprising a tetracycline operator. The vector also contains a cloning site operatively positioned downstream of a basal promoter comprising a tetracycline operator. The TREWs can be used to produce stable cell lines in which gene expression is tightly requiated by tetracycline. They can be used for the production of proteins such as tumour suppressor proteins which can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers.

New method for increasing the proliferative capacity of cell lines comprises administering agents reversibly activating telemerase activity and reversibly inactivating ${\rm Rb/iNK4}$ and/or ${\rm p53}$ pathways useful in treating age related diseases

laim 5; Paqe 121-123; 123pp; English.

out, the number of mitotic divisions, of a cell, The method relies on activation of a telemerase activity and inhibition of one or both of a retinctional control of a set method satural pathway or a p53 pathway. Thospherylation of a by cyclin dependent kinases, cdk4 and cdk6, releases the cells into the division cycle. Binding of INK4 tamily members, e.g. the tumour sepressor pictures, inhibits kinase activity and results in growth arrest. We inactivators can setterively and reversibly inactivate an PEC NR1 pithway. Expecially as Edoplinkia pathway. The uncoprotein MOM2 is a cellular inhibitor of Mb/H2F function and the p51 tymour suppressor treat conditions related to (premature) ageing, e.g. macular degeneration lines in vitro and for studies on biochemical and physiological aspects or growth and differentiation. Long lived (immortal) cells could also be invention concerns methods and reagents for extending the lite-span. and can also be used in the methods. Other molecules which can be used include cdk4 or cdk6 mutants. In particular, a cdk4 mutant is one which differs from at one or more of residues K22, F34, H95 and 6 gar. increasing the proliferative capacity of cells. The cells are subsequently of use in pharmaceutical and cosmetic preparations used to Additional constructs include a papilloma virus E7 protein, or other virul oneoprotein which typasses Bb and/or pG3. Antisense constructs of and arterioselerosis. The cells can also be used to replace tumour cell The methods are useful for use in the production of normal or genetically engineered the Rb and pl61NK4a genes may also be used. biotechnology products.

The present sequence encodes a human androgen receptor coactivator designated Rb. Androgen receptor to activator proteins from the present invention can be used in screening assays to identify candidate pharmaceutical molecules for the ability to promote or inhibit the interaction of androgen receptors and androgen responsive elements to modulate androgen receptors and androgen responsive elements to or activity. The identification and characterisation of androgen receptor co-activity autors such as those of the invention will treillitate the development of screening assays to evaluate the potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel androgen receptor-associated proteins used to detect androgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | DEFECT | D

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be fested for anti-neoplastic activity, determining a change in agents to be settled to a signature gene set, where (I) comprises a sequence (S) selected from 6447 sequences (given in Abribido) to the settlement of the fest of selected from 6447 sequences (given in Abribido) to the settlement of the settlement of the settlement of activity and can be used in quen inbrangy. MI can be used for screening a nati-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a crossit of MI, and the data is sufficient to couvey the chemical structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the crossit such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, procale or panceatic cancer, adenorarian advances and many cell cancer, infiltrating ductal cancer, and militaring dobular cancer, squamous cell cancer, infiltrating ductal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      253 CSCAGGACCICCCICCICACGCTTGAGTTTGAAGAAACAGAAACCIGATTTTACTG 312

```
This sequence encodes a modified relimoblastoma tumour suppressor
protein (RTSP) of the invention. The proteins can be used for inhibiting
cellular proliferation, when coadministered with a p53 protein. The XTSPs
can be used for treating diseases characterised by abnormal cellular
proliferation, particularly cancers. The RTSPs have a broader spectrum of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 COGGAGGACOTOCTOTOGGGGTTGAGTTTGAAGAAAGAAAGAAGAAGAGCTGATTTTACT 180

```
This is the nucleic acid sequence of a cDNA of the normal human retinoblastoma gene Rb. Absence or mutation of the Rb gene (see also ARAGACA) prodisposes an individual to retinoblastoma. To isolate Rb cDNA, the human DNA probe pH3-8, isolated from a human chromosome H3 lambda phage library, was used in a chromosome walk to isolate and map 30 kb of genomic DNA surrounding the H3-8 to isolate and map 30 kb of genomic DNA surrounding the H3-8 sequence. Fragment pDH30.7R (ATCC 97500) was obtained, and was used as a probe to sorrow a chNA therapy that had been constructed from an adenovirus 12-transformed human embryonic retinal cell from an adenovirus 12-transformed human embryonic retinal cell blots cross-reacted with a 4.7 kb transcript in transformed cells which was not present in 4 retinoblastoma and one corrows.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         deletion or point mutation in the Rb gene of a human patient. The gene can also be used to synthesize Rb polypeptide (see AAX01542) for

Diagnosis of retinoblastoma · using genetic material corresp. to a normal
human retinoblastoma gene or a unique sub-region
                                                                                                                                                                                                                                                                                                                                                                                                                                                       This gene encodes a protein, the absence of which is associated with a neoplasm. It is used to produce an autibod, to the protein, contacting this with the tumour sample and detecting immune complexes as indication of the presence in the tumour sample of the protein. Whole sequence or a unique sub-region can be used. The method identifies patients lacking the defective retinoblastoma (Rb) allele and thus are not at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             177

The invention relates to an anticancer agent comprising mycolactone. Also included for is an arriagner agent comprising mycolactone and antisanse inhibitors of relinchlastoma (Rb) protein expression. The anticancer agent is used for the treatment of cancers such as breast, bladder, skin, stommen, liver, colon and oral cavity, lymphoma and cukaemia. The anticancer agent induces apoptotic death of cancer cells and the Rb inhibitor increases the apoptotic death of cancer mycolarone are in the Rb inhibitor ancer apoptotic fact in grand is specific to cancers in which Rb proteins are optionally expressed and mycolactone shows very strong anticancer effect in gite as well as in gro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         254 CGGAGGACCTGCCTCTCGTCAGGCTTGAGTTTGAAGAACAGAAGCTGATTTTTACTG 313

protein (RISP) of the invention. The proteins can be used for inhibiting callular proliferation, when coadministered with a p53 protein. The RISPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The RISPs have a broader spectrum of activity than wild type RISPs.

This arquamer enoughs a modified retinoblastoms tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting collular proliferation, when coadministered with a p53 protein. The kTSPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The RTSPs have a breader spectrum of

This acquence encodes a modified retinoblastoma tumous suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting cerilular prollieration, when condministered with a pSP protein. The FTSPs can be used for treating diseases characterised by abnormal cellular prollieration, particularly cancers. The RTSPs have a broader spectrum of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             361 AĞAĞTGILIMAAGAAGTATGATGITTIĞITTIĞÇAĞTÇITLIĞAĞCAAATTGGAAAGGAÇATGI 420

This sequence encodes a modified relinoblastoma tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting relinial profileration, when conduintstered with a p33 protein. The RISPs of the used for treating diseases characterised by abnormal collular. proliferation, particularly cancers. The RTSPs have a broader spectrum of FITTER FOR THE PROPERTY OF THE 268 GAGCIA/NGAAAAACAIAGAAAICAGIGCAIAAAIICIIIIAACIIAGIAAAAAAAIT 327 241 GAGAAAGITICAICIGIGGAIGGAGIATIGGGAGGITAIAIAITGAAAAGAAAAAGGAACIG 300 -----GGTCGACCTAGATGAGATGTCGTTCACTTTTACT 267 (5) GAGCTACAGAAAACAYAGAAATCAGTIGTGCATAAATTCTTTAACTTAACTAAAAGAAATT 420 328 GATAGGAGTAGGAAAGTTGATAATGCTAATGAGAGTGTTGAAGAGTATGATGATGTTG 387 121 GATACCAGIACCAAAGTIGAIAAIGTIAIGICAAGACTGITGAAGAAGTATGAIGIAITG 480 388 LITEGRALICTTCAGCAAATTGGAAAGGACATGTGAAACTTATATTTTGACACAAAACCCAGC 447 448 ASTICGAIAICIACIGAAAIAAATTOTGTATIGGGFGATAAAAGIIIGIIGGAICACAIIT 507 SER FITALITAKUTAAAGGGGAAGTATTACAAATGGAAGATGTGGTGATTTCATTTCAGTTA 567 6. ```
New retracycline responsive expression vectors - used for the tightly controlled expression of genes, such as tumour suppressor genes for freating cancers
```

Disclosure: Pages 145-150: 190pp: English.

The present sequence appears in the specification, which describes a terracycline responsive expression vector (TRFV), which contains a sequence encoding a tusion protein comprising a transcriptional transactivation domain (TIE) pretainely attached to a tetracycline repressor protein (TRF), the first sequence operatively positioned downstream of a bosoncer. The vector also contains a cloning site operatively positioned downstream of a based promoter comprising a terracycline operator. The TREVS can be used to produce stable cell lines in which gene expression is Lightly regulated by lefracycline. They can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers.

treat conditions related to (premature) agains, e.g. macular degeneration and arteriosclerosis. The cells can also be used to replace tumour cell lines in vitro and for studies or biochemical and physiological aspects of growth and differentiation. Iong lived (immortal) cells could also be of use in the production of normal or genetically engineered.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              e.g. the number of mitoric divisions, of a cell. The method relies on activation of a telometrase activity and inhibition of one of both of a retinoblastoms (Pb)/INK4 pathway or a p53 pathway. Phosphorylation of Rb by cyclin dependent Kinascs, odk4 and cdk6, releases the cells into the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         division cycle. Binding of TMK4 family members, e.g. the tumour sittesset planks. Edities thase article and results in grach arrest. Be inactivated an selectively and recersibly inactivate an PP TMK4 perlang reportedly, a. Profitting perlang. The enceptation of the conspication of the constraint and can also be used in the methods. Other molecules which can be used include cdk4 or cdk6 mutants. In particular, a cdk4 mutant is one which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention concerns methods and readents for extending the life span.
                                                                                                                                                                                                                                                                                                           New method for increasing the proliferative capacity of cell lines comprises administering agents reversibly activating telomerase and interestibly inactiviting Ph/INM4 and/or p53 pathways useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        subsequently of use in pharmaceutical and cosmette preparations used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               wird oncoprotein which bypasses Rb and/or p53. The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical application to be tested for anti-neoplastic activity, determining a chemical agent to be tested for anti-neoplastic activity, determining the competition of at least one gene (I) of a signification of the feat one gene (I) of a signification of a feat consistence (I) has cylostatic activity and can be used for producing a product which is the data conflicted with respect to the anti-neoplastic agent which is sufficient to convey the chemical activity and the data is sufficient to convey the chemical cannot be used in the consistence of cancer and as colon, breast, stomach, lung, thyroid, one sophageal, ovarian, kidney, prostate or pancreatic cancer, represent and Milm's tumour, infiltrating ductal cancer, infiltrating ductal cancer, squamons, papillary catching and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       269 ASCIACAGAAAAACAIAGAAAICAGIGCAIAAAIICIIITAACIIAACIAAAAAAIIS 328

This sequence encodes a modified retinoblastome temour suppressor protein (RYSP) of the invention. The proteins can be used for inhibiting cerlular proliferation, when coadministered with a p53 facterin. The KISPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The RISPs have a broader spectrum of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 GAAPPERESSANTAPPERESPERIESPERENTERPERAGAGAGGAGGAGGAGGAGGAPAGGGAPAGGGG 120
